TECHNICAL & FINANCIAL PROPOSAL

Web Application Software Testing & Quality Assurance

Prepared by: Ahmed Sherif
Software Tester / QA Freelancer

1. Executive Summary

I am pleased to submit this proposal for Software Testing and Quality Assurance of a web application.
The objective is to evaluate the application from both functional and usability perspectives, identify defects, and provide clear documentation that helps the client deliver a reliable and user-friendly product.
The proposed service includes test planning, manual functional testing, UI and usability checks, defect reporting, regression testing, and a final quality summary. My approach focuses on accuracy, clear communication, and practical results that can be used directly by the development team.

2. Introduction and Background

The success of a web application depends not only on development but also on the quality of the final product. Testing helps ensure that the application works according to its requirements, handles expected and unexpected user actions, and provides a consistent experience across supported environments.
As a Software Testing / QA freelancer, I will work through a structured testing process based on the available requirements and application features. The work will be organized using standard QA practices and documented in a professional and easy-to-follow format.

3. Proposed Solution & Added Value

The proposed solution is a structured manual testing process covering the main user journeys and important application functions.
Main activities:

- Review available requirements and understand the expected behavior.
- Prepare a practical test checklist and test cases.
- Perform functional testing of major features.
- Test positive and negative scenarios.
- Check forms, validations, navigation, links, and user flows.
- Report defects with clear steps to reproduce, expected result, actual result, severity, and priority.
- Perform regression testing after fixes.
- Provide a final testing summary.

Added value:

- Early identification of defects before release.
- Clear and actionable bug reports for developers.
- Better coverage of critical user journeys.
- Reduced risk of releasing unstable features.
- A documented testing process that can be reused in future releases.

4. Timeline and Deliverables

The project is planned to be completed within 7 working days.

Day 1: Requirement review, application walkthrough, test scope definition.

Days 2–3: Test case preparation and functional testing.

Days 4–5: Detailed defect reporting and additional scenario testing.

Day 6: Regression testing of fixed issues.

Day 7: Final verification and quality summary.

Deliverables:

• Test checklist / test cases.

• Bug and defect report.

• Test execution results.

• Regression testing results.

• Final QA summary report.

5. Resources

The project will require the following resources:

• QA tester: Ahmed Sherif.

• Test environment: Client-provided web application or staging environment.

• Test data: Suitable test accounts and sample data supplied or approved by the client.

• Tools: Jira or another issue-tracking system, browser developer tools, spreadsheets, and documentation tools.

• Communication: Online communication through the client's preferred platform.

The client is expected to provide access to the application, requirements or feature descriptions, and any necessary test credentials.

6. Technical Specifications

Testing will focus on the following areas:

Functional Testing:

Verify that each major feature performs according to its expected behavior.

UI and Usability Testing:

Check layout consistency, labels, buttons, forms, messages, navigation, and basic usability.

Validation Testing:

Verify required fields, valid/invalid inputs, boundary cases, and error messages.

Compatibility Testing:

Check the application on commonly used browsers such as Google Chrome and Microsoft Edge, where applicable.

Regression Testing:

Retest corrected defects and affected functionality to ensure that changes did not introduce new problems.

Defect Reporting:

Each confirmed defect will include a clear title, environment, preconditions when needed, steps to reproduce, expected result, actual result, severity, priority, and supporting evidence when available.

7. Terms and Conditions

• The proposal covers manual Software Testing and QA activities described above.

• Testing depends on the availability of the application and required access.

• Any major change in project scope may require an updated timeline and price.

• Defects will be reported clearly, but fixing defects is the responsibility of the development team unless separately agreed.

• Client feedback and access should be provided in a timely manner to maintain the agreed schedule.

• Confidential project information will be treated professionally and will not be shared with third parties.

• Final delivery will be provided after completion of the agreed testing scope.

8. Conclusion and Call to Action

This proposal provides a practical and structured approach to improving the quality of the web application before release. By combining functional testing, clear defect reporting, regression testing, and a final QA summary, the project can reduce release risk and improve the overall user experience.

I would be happy to discuss the application, testing scope, and priorities with the client and start the testing process after access and requirements are provided.

Thank you for considering my proposal.

Best regards,

Ahmed Sherif

Financial Proposal

Item	Details
Estimated Project Price	EGP 2,500
Estimated Duration	7 working days
Payment Terms	50% at project start, 50% after final delivery
Included Revisions	One regression/review cycle after reported fixes
Additional Scope	Quoted separately after agreement with the client

End of Proposal
